## IAM CLOUD WORKSHOP

### SECURELY ENABLING YOUR JOURNEY TO THE CLOUD

Trying to figure out how to balance security, agility, and end user requirements to use more cloud services while controlling cloud identity sprawl? Worried about moving your applications and sensitive data to the cloud while still leveraging your investment in your current identity and access management solution?

Where do you start? How do you prioritize which applications to migrate? How do you manage users in your hybrid enterprise?

Neovera's workshop takes the fear factor out of moving your applications to the cloud and allowing your users to leverage 3rd party public cloud services and SaaS based applications. We help you understand how to accelerate secure cloud adoption from your enterprise to the cloud and back.

#### PRIORITIZE IAM CLOUD RISKS & ROADMAP

This half day workshop delivered on-site, we introduce the basic principles for managing identity and access management across your hybrid enterprise. We will also help you identify and prioritize key applications to migrate to the cloud.

Our goal is to share identity and access management best practices and apply that to user management and application security.

We will help you better understand how to utilize security standards for single sign on, federation, and others that your organization can use to protect yourself, and prioritize next steps for cloud migration.

#### YOUR IAM, YOUR WAY

Customized to your needs, this interactive session is a unique opportunity for business and security leaders to understand their exposure and make informed decisions about identity and access management.

## Key Topics //

- » How to control cloud identity sprawl
- » Gain visibility into identities and cloud application usage
- » How to automate user provisioning across your hybrid enterprise
- » Multi-Factor authentication is here to stay, how to scale
- » Build an identity and access management cloud roadmap
